

Ojo Dominatrix

Based on:

Okko Dominator MKII

Effect type:

Dynamic High gain Distortion

Build difficult:

Average

Amount of parts:

High, total 81 components

Structure:

Jfet Buffer + 3 Opamp gain stages
+ Active EQ.

Power consumption:

9V

Enclosure type:

1590bb

Get your board at:

Project overview:

This is the über-evil twin brother of the [Ojo Diablo!](#) Made to deliver the most extreme metal tones. It's all there: massive gain, lightning speed attack, aggressive punch, super-tight low end and clarity of chords through the entire gain range. The active 3-band EQ with and an additional Mid-range pot that adds much more versatility than the original toggle.

This version does not feature the gate on board.

Introduction

There are always some pedal brands that somehow manage to fly under the radar of the gear nerds no matter what they offer sound wise. Okko™ is one of them, barely known outside of Germany but full packed with finest engineering and tones that just deliver your modern needs.

A build in charge pump for more headroom. (Make sure your electrolytes can handle them) a super powerful EQ and Distortion with its own voice and powerful attack. I mean... You can imagine that I build quiet a lot drive pedals but this one ended up on my board right after I put it in the enclosure. Not even needed an artwork on the 1590BB... Just had to play it.

The original unit has a toggle for the mids, we replaced this with a potentiometer for the ultimate control over the - for guitar elementary - mids.

Side note, there is a 15v regulator that's pretty tall. I would solder it on the very end of the build. Right after you drilled the enclosure so you get an idea for the best angle. Don't make the same mistake I did. Could barely fit it in the enclosure.

Controls

- Gain
- Volume
- Bass
- Mids
- Treble
- Mid-range

Components Recommendations

This board has been tested using Film box capacitors for most of the values over 1nf, and ceramics discs for the ones under 1nf. However, high quality components such as Wima's Capacitors and Panasonic's electrolytics can deliver a better performance.

All the resistors used for testing this project are 1/4W Metal Film.

The BOM and Shopping list are exclusively regarding this project. It doesn't include all the hardware like the 3PDT bypass switch, audio/dc jacks, enclosure, etc.

This boards allows you to use BF245 in SMD version or standard through hole. Choose and place either of them. A common replacement for this transistor could be MPF102 flipped 180 degrees to the silkscreen. However this has not been tested yet.

C24, C25, C26, C27 Must be at least suitable for v25!

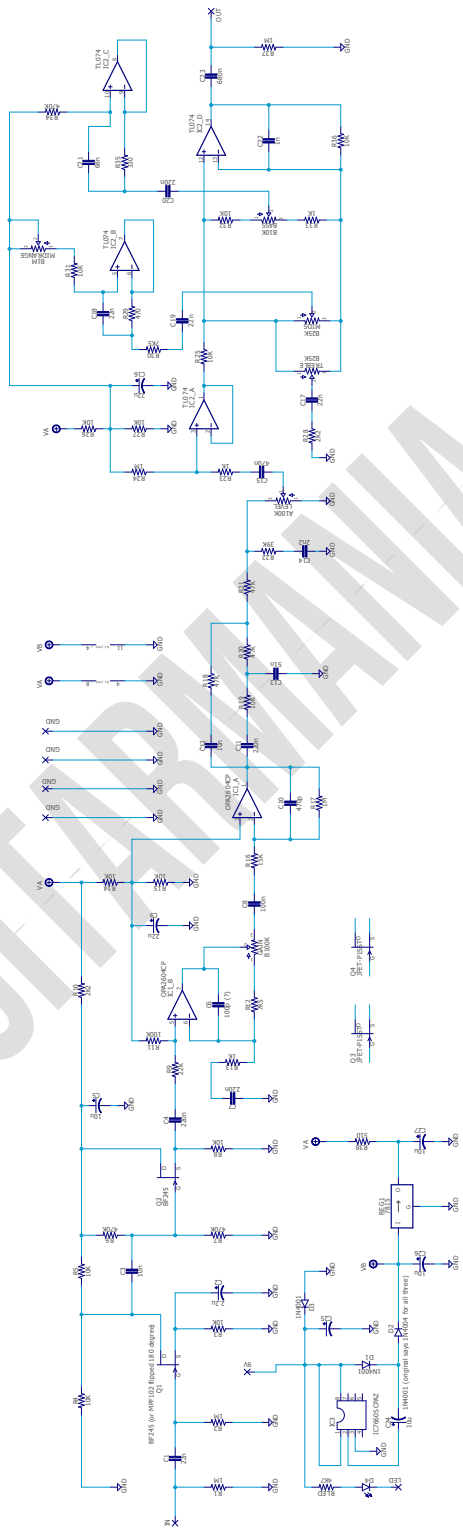

Build Notes

If this is one of your first projects I recommend you to take a look on our [Pedal Building Guide](#)

For a successful and tidy build it's recommended the following order:

1. Resistors & diodes
2. Capacitors, starting with the smaller ones and the ceramic ones.
3. Electrolytic capacitors (always check the polarity)
4. Transistors
5. Wires
6. Potentiometers and switches
7. Off board wiring

Schematic

Wiring Diagram

All our projects include a free 3PDT Board to make the wiring easier and tidier. Also all of our PCBs feature the status LED on board.

The pad named “Ctrl” or “LED” is the one that controls the status of the led, wire it to the “LED” pad on the 3PDT board, or in control slug of your 3PDT.

This board has been designed to match our EZ 3PDT PCB check it [here](#) to access to our [Pedal Wiring Guide](#)

Drill Template

This Project has been planned to fit into a 1590bb enclosure type.

Check the Attached “Drilling templates” to drill the box properly. The files are on Scale 1:1, ready to print in an A4 page.

Licensing and Usage

We really appreciate your trust and support buying this PCB, as well as your will to dive into the DIY electronics world. That’s why for us is really important that you can make this project work properly and to enjoy not only the building process, but also to experiment and play with it on your rig.

We try to reply to every question we receive on our email or in our social media, but we try to encourage all our customers to join our [PCB Guitar Mania – Builders Group](#) on Facebook, in order to post all your doubts, issues, suggestions or request, as well to share your builds and have some feedback from us and other fellow builders!

All of our projects have been tested following this same guide on their standard configurations. Although, not all of the variations and mods have necessarily been tested. These are suggestions based on the schematic analysis, and on the experiences and opinions of others. Feel free to share with us your opinions and suggestions regarding the mods your own personal experimentation.

These boards may be used for commercial endeavors in any quantity unless specifically noted. No attribution is necessary, though accreditation or a link back is always greatly appreciated.

If you are a builder planning to make your own run of pedals we also offer the service of custom made boards with your brand and logo, design according your specifications.

The only usage restrictions are that, first, you cannot resell the PCB as part of a kit without prior arrangement with us, and second, you cannot scratch off the silk screen, or other way of trying to hide our logos and the source of the PCBs. Like it’s written above, if you want to have your own designs, with your brand and logo we could certainly reach an agreement.

Follow us on [Instagram](#) and [Facebook](#) to stay in tune with the latest projects!
