

# Swedish Metal

**Based on:**

BOSS HM2

**Effect type:**

High gain Distortion

**Build difficult:**

Advanced

**Amount of parts:**

High, total 82 components

**Technology:**

Dual OpAmp

**Power consumption:**

9V

**Enclosure type:**

125b

**Get your board at:**

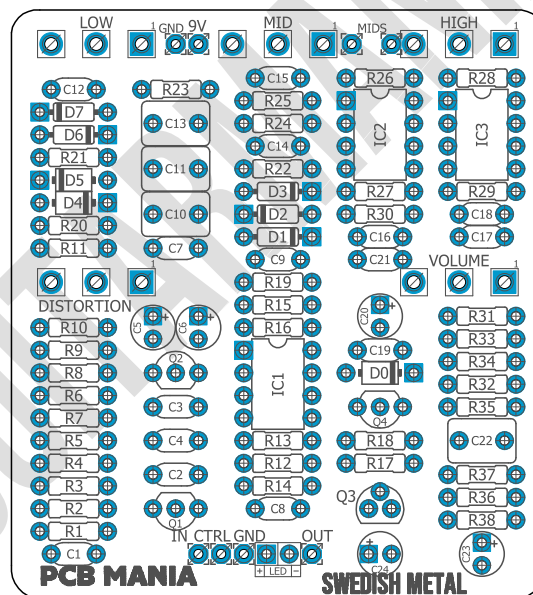

[Swedish Metal](#)

**Get your kit at:**

[Das Musikding \(Europe\)](#)

**Project overview:**

Inspired by Boss HM2, one of the most important distortion pedals in metal's history which defined 80s heavy metal tone. This pedal is a cult classic that any guitarist must-have has a companionship.

## Introduction

---

We actually do not understand why the Boss MH2™ even has knobs, but we added one more to make it more useful. I mean, you crank them all and get the sound 1990 metal tone from Sweden. Instant Entombed buzzsaw tones just by pushing the footswitch down. But still, giving the EQ a third band makes it easier to use it with all kinds of amps. Make sure you check the footprint of the 2.2uf you buy. They can cause some headaches if you source too big ones.

There is scarcely a more important pedal in underground metal. Used in many different contexts across the last three decades, it is still in force and vigorous than ever.

## Controls

---

- DISTORTION
- HIGH
- LOW
- MID\* (Optional)
- VOLUME

1	3mm LED	LED

# Schematic

# Components Recommendations

---

As many people like to experiment with some pedals with higher voltage, always ensure your **electrolytic capacitors'** max tolerance is over 25v.

This board has been tested using Film box capacitors for most of the values over 1nf and ceramics discs for those under 1nf. However, high-quality components such as Wima's Capacitors and Panasonic's electrolytics can deliver a better performance.

All the resistors used for testing this project are 1/4W Metal Film.

The BOM and Shopping list are exclusive regarding this project. It doesn't include all the hardware like the 3PDT bypass switch, audio/dc jacks, enclosure, etc.

**Mids control MOD\*** This board supports possibility of including a Mids control to make this metal machine more versatile. To do so you have to place a jumper in between the pads labeled MIDS on top in between High and Mid pots and replace R27 for a 100k resistor and C16 for 10n capacitor. Bear in mind this mods will alter the overall character of the pedal. For stock version leave the mids pot unpopulated.

## Build Notes

---

If this is one of your first projects, I recommend you to take a look at our [Pedal Building Guide](#).

For a successful and tidy build, it's recommended the following order:

1. Resistors & diodes
2. Capacitors, starting with the smaller ones and the ceramic ones.
3. Electrolytic capacitors (always check the polarity)
4. Transistors
5. Wires
6. Potentiometers and switches
7. Off-board wiring

In the 1.0 version, almost all the values of the schematic are missing, so we add them in this one.

## Wiring Diagram

---

All our projects include a free 3PDT Board to make the wiring easier and tidier. Also, all of our PCBs feature the status LED on board.

The pad named "Ctrl" or "LED" is the one that controls the status of the led; wire it to the "LED" pad on the 3PDT board or in the control slug of your 3PDT.

This board has been designed to match our EZ 3PDT PCB; check it [here](#) to access our [Pedal Wiring Guide](#).

## Drill Template

---

This Project has been planned to fit into a 125b enclosure type.

Check the Attached “Drilling templates” to drill the box properly. The files are on Scale 1:1, ready to print on an A4 page.

## Licensing and Usage

---

We really appreciate your trust and support in buying this PCB, as well as your will to dive into the DIY electronics world. For us, that's why you can make this project work properly and enjoy not only the building process but also experiment and play with it on your rig.

We try to reply to every question we receive on our email or our social media. Still, we try to encourage all our customers to join our [PCB Guitar Mania – Builders Group](#) on Facebook to post all your doubts, issues, suggestions, or requests, share your builds, and have some feedback from other fellow builders and us!

We tested all our projects following this same guide on their standard configurations. Although, not all of the variations and mods have necessarily been checked. These are suggestions based on the schematic analysis and the experiences and opinions of others. Feel free to share with us your views and recommendations regarding the mods your personal experimentation.

These boards may be used for commercial endeavors in any quantity unless expressly noted. No attribution is necessary, though accreditation or a link back is always much appreciated.

If you are a builder planning to make your own run of pedals, we also offer the service of custom-made boards with your brand and logo, design according to your specifications.

The only usage restrictions are that, first, you cannot resell the PCB as part of a kit without prior arrangement with us, and second, you cannot scratch off the silkscreen or other way of trying to hide our logos and the source of the PCBs. Like it's written above, if you want to have your designs with your brand and logo, we could undoubtedly reach an agreement.

Follow us on [Instagram](#) and [Facebook](#) to stay in tune with the latest projects!
